

# **Fitness Challenge Sip**

**Gavin Hill**

**[IMAGE OF PROTOTYPE]**

---

## **Technical Field**

This Project involves the areas of Computer Science and Web Design.

## **Background Information**

This web design idea came from many people who have stayed motivated to work out. At first, they feel excited, but later they stop because they lose discipline. This project helps by adding friendly competition and rewards based on how much weight a person lifts or how many reps they do.

## **Prior Art (Research)**

Plat Fitt – detects the phone movement during daily fitness games so users can earn coins for power-ups. It turns regular exercise into a fun, game-like experience with daily and weekly goals such as push-ups, squats, and steps.

My innovation is different because by using the phone web based it goes against other people by weights and running and others. For rewards it gives out gift cards, gift certificates, and merch.

Step Bet – it's a fitness app that encourages users to stay active by betting money on themselves to reach personalized step goals. Users win rewards when they meet their targets for a set number of weeks.

My innovation is different because it judges based on what is your max out weight so if a person squats 110lb then it records that record until their friends, club, or others beat it.

Strava – This allows users to compete in fitness goals such as running or cycling certain distances within a set time. It motivates users through competition, badges, and community leaderboards.

My innovation is different because it does weights and runs. What they also did not include was the rewards maybe for badges, but this is for gift cards to your favorite shopping or online merchandise.

## **Project Description**

This app is about tracking strength workouts and combining the results into a single score. It also allows friends to compete on a monthly leaderboard, where whoever is on top that person wins rewards like gift cards or workout gear. The app is designed for people who want to exercise with friends, clubs, or school groups.

## **Innovation Claim**

This project is innovative because it lets friends compete. It tracks workouts based on weights and reps, and it offers rewards to keep users motivated.

## **Usage Scenario**

This web design can be used by school sports teams or gym classes to track students' progress and create a competition. So that coaches or teachers could use the system to help students and reward improvement overtime. It also can be used for personal trainers, clubs, or with friends.

## **SIP BRIEF PART 2**

## **Evaluation Criteria**

“The following questions will identify the successful completion of the project.”

Create a list of “**Yes/No**” questions that will form the criteria for YOU to determine the success/completion of your project in terms of usability or usefulness of the product you will eventually prototype. (This list will NOT be used by your SME – it will act as your To-Do list).

Provide as many criteria as required to assure the quality of the project; each one needs to be expressed in such a way that it is measurable or observable and should be in the form of a **yes or no** question. Also, do NOT answer the questions. This is simply a list of what the criteria are.

## **Goals and Tasks Associated with the Project**

List and describe the High-Level objectives of this project. These should include the targeted areas of completion that will guarantee the success of your project. (Each objective will eventually have several tasks associated with it.)

After giving the objectives, list and describe all tasks that will allow you to complete each objective. Tasks are the specific actions required to achieve the objectives. The Evaluation Criteria mentioned above will ensure that the quality is ultimately measurable or observable. Each task shall be described in detail and include transparency on the decision-making process.

Use headings for each task to maintain clarity in the documentation. Use dates (if known) to specify when the tasks will be completed and implemented.

**Note: This section must be revised prior to SIP408 to describe tasks as they actually occurred.**

## **Description of Design Prototype**

Describe the **design prototype** implementation. You should describe the platform on which the system will be built and provide directions on how to run the prototype (if necessary). Elaborate on the functionality of the parts that define your project. Effective descriptions will give the reader an understanding of what the design prototype will be, and how it relates to the final project.

**Note: This section will be revised prior to SIP408 to describe the design prototype in its final form.**

### **SIP Brief Part 3 – to be filled out in SIP409**

## **Evaluation Plan**

Provide a complete, paragraph-style description of the plan used to evaluate your project. This section should be a **description of the full plan** for how you will go about answering the “Evaluation Criteria” questions. Do not simply repeat the questions!

**Note: This section must be revised in SIP409 to describe the full evaluation plan as it was actually implemented.**

## **Project Completion Assessment**

**Note: This section must be completed in SIP409**

Provide an in-depth description of the completion assessment of your project. Describe how well the completed components function and highlight the innovative facets of your design. This is sometimes known as a “Post-Mortem” or “Lessons-Learned Report”. A good approach for this section is to answer the following 4 questions: “What went right? What went wrong? What was learned throughout the process? What would be done differently if you had to do it again?”

## **Appendices**

**Note: This section must be completed in SIP408.**

Include as appendices any supporting material for this project, including charts, graphs, and other data; images associated with the project; or other documentation (e.g., a game design document or read-me file). Include any prior art that was used such as U.S. Patent Documents, Foreign Patent Documents, or other sources. Remember that this section should only be a list of additional files, not the actual data of the files!

Use the following format:

Appendix letter: description of item – file name

Example...

Appendix A: Game design document – myGameDoc.docx

Appendix B: 3D render of primary character – mainCharacter.jpg
